Debate protocol

“Robust enough” is a decision, not a number — run it yourselves in 20 minutes

0:00–2:00	Read. Pick one scenario card (medical triage / authentication / autonomous control). Everyone reads the facts box. Deal the four role cards; if you are three, the verification engineer’s card is shared.
2:00–10:00	In role. Each role states its goal in one sentence (1 minute round). Then argue the decision sheet line by line, starting with <i>the property</i> and <i>the region</i> . Stay in role; use the “uncomfortable question” on your card at least once.
10:00–15:00	Converge. Out of role. Fill every line of the decision sheet. Blank lines are allowed only if you write <i>why</i> you could not agree.
15:00–20:00	Challenge. Swap sheets with a neighbouring table. Read theirs; challenge exactly one line in writing; hand it back.

Ground rules

- A number without a region is not an answer (“99 % accurate” — on which inputs?).
- A proof without its assumptions is not an answer (“proved safe” — for which region, under which model of the world?).
- “We will test it more” is not an answer to a counterexample the verifier found in a second.
- Every line of the sheet has an owner. Write the role, not a name.

If you get stuck

1. *What is the region?* Name the inputs, their ranges and units. If you cannot, the debate is about that.
2. *What happens the first time the verifier reports a counterexample (✗) in production?* Who is told, in what time, and what is switched off?
3. *Who wrote the sentence, and who checked it against the world?* The San Antonio recall was a specification, not a perception failure.

Afterwards. Take the sheet to your own project with the worksheet *Specify your system* (NNV-WS): one requirement as a sentence about every input in a region, what a counterexample would look like, and what cannot be verified this way.
